

Summary Report for Climate Change & Tourism Planning Workshops

PURPOSE

The purpose of these workshops was to strengthen relationships across tourism stakeholders, develop collective strategies, and build capacity to address the uncertainty of climate change as it relates to impacts to tourism and recreation. This work engaged with and addressed community goals, concerns, and potential action strategies in order to brainstorm steps and support successful, community driven climate change planning.

KEY FINDINGS

- Changing visitation patterns and modeling a more sustainable tourism destination were identified as the most important climate change impacts/ opportunities to address.
- Action strategies included:
- (1) focusing on communication and education of visitors, residents, and tourism professionals,
- (2) further developing sustainable transportation,
- (3) continuing to collect and share visitor data,
- (4) maximizing tourism suppliers' abilities to adjust to shoulder season visitation.

CONTEXT

- Climatic changes and resulting impacts that may affect coastal destinations include sea level rise, extreme weather events, flooding, saltwater intrusion, erosion, and ocean acidification.
- Tourism destinations will face changes in ecological conditions and visitation patterns as a result of climate change.
- Participatory planning workshops can increase tourism destination capacity to adapt to climate change and expected changes in visitation.
- Workshops can increase the likelihood that decisions are locally appropriate, accepted more readily by local actors, and include a more diverse set of values, needs, and perspectives.

Over the course of two virtual workshops, tourism stakeholders on MDI (a) identified and prioritized local climate change impacts to tourism on MDI and (b) discussed potential action strategies and voted on the most important strategies to address immediately.

WHAT DID WE DO?

- The research team collaborated closely with a small group of tourism planning partners to develop and refine our workshop framework (Figure 1).
- Tourism stakeholders included: business owners, National Park Service staff, and non-profit employees whose work aligns with climate change and tourism planning.
- A total of twelve participants attended at least one workshop.

Figure 1. During day 1, participants focused on climate change impacts (positive and negative) to tourism on MDI. For day 2, participants brainstormed action strategies to address changes in visitation and developed ideas for becoming a more sustainable tourism destination.

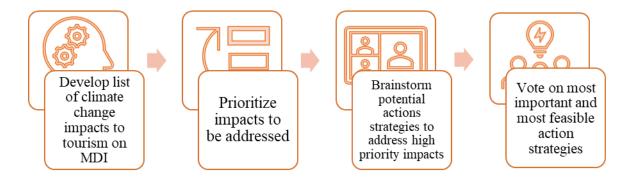

Table 1. Ranking of climate change items by significance of their ability to impact tourism on MDI (top five rankings).

RANKING (1 = most important or easiest to address)	MOST SIGNIFICANT CLIMATE CHANGE IMPACTS AND OPPORTUNITIES TO TOURISM ON MDI	EASIEST CLIMATE CHANGE IMPACTS FOR TOURISM SYSTEM TO ADDRESS
1	Increasing visitation	Opportunity to model sustainability (mitigation actions)
2	Opportunity to model sustainability (mitigation actions)	Challenges with island access from flooding/ extreme weather events
3	Shifts in seasonality of visitation	Increasing visitation
4	Increasing pressure on housing availability and land usage	Different patterns of winter outdoor recreation
5	Higher fire risk in summer	Increasing pressure on housing availability and land usage

WORKSHOP RESULTS: DAY 1

- Participants co-developed a list of climate change impacts related to MDI's tourism system. This comprehensive list was first discussed within two small breakout sessions and the final list of impacts were decided upon as a larger group.
- We condensed these climate change impacts into two overarching categories: changes in visitation patterns and modeling MDI as a sustainable tourism destination (Figure 2).

Figure 2. Overview of the overarching categories encompassing the climate change impacts ranked and prioritized on day 1.

Changing Visitation Patterns

- Increasing visitation
- Changes in timing of visitation
- Changing winter recreation patterns

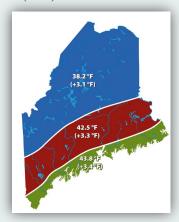

Modeling a sustainable tourism destination

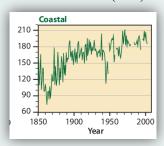

- Mitigation of climate change impacts
- Visitor education
- Impacts fell into six broad categories: (1) increasing heat and temperatures, (2) changes to precipitation and water resources, (3) changes to flora and fauna, (4) unpredictability of impacts, (5) changes in visitation, and (6) human impacts from climate change and increased visitation.
- Using two dot votes, participants ranked the impacts they listed according to highest concern to the tourism system and most readily able to address (Table 1).

SOME CLIMATE CHANGE INFO ABOUT MAINE

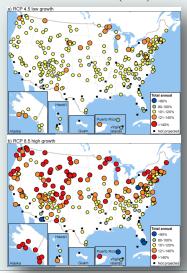

Average annual temperatures by climate division and increases in average annual temperatures since 1895. Source: Maine's Climate Future (2020).

Growing season length from 1850-2000. Summers are getting longer and Maine's shoulder seasons are seeing increased visitation. Source: Maine's Climate Future (2015).

Visitation to ANP is expected to increase as temperatures warm. Source: Fisichelli et al. (2015).

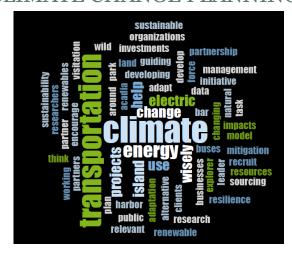

WORKSHOP RESULTS DAY 2

- Participants identified multiple adaptation actions within two main areas 1) modeling green tourism on MDI and
 2) addressing changes in visitation.
- As a large group, we combined the identified actions within four major categories that would address both modeling sustainability and addressing increases in visitation:
 - 1. Target <u>communication and education efforts</u> across the island to a variety of groups, including visitors, residents, and those working in the hospitality industry. Specifically, discussions centered around developing communications for visitors to ensure <u>winter safety</u> and <u>access</u> and <u>hospitality training</u> for employees.
 - 2. Focus efforts on <u>transportation</u> across the island to increase the walkability of the downtown, reduce traffic through strategies such as carpooling, and increasing bike lanes.
 - 3. Continue to <u>collect</u>, <u>analyze</u>, <u>and share data regarding</u> <u>visitation</u> to MDI to ensure collaboration and inform management actions (e.g. carpooling).
 - 4. Maximize the ability of the hospitality industry to handle <u>increasing visitation</u> during the <u>shoulder seasons</u>. This would increase flexibility and require changes in staff hiring and retention, housing, and infrastructure.

Note: Adaptation actions are listed based on a group vote of those requiring immediate action, such that communication and education was the top priority.

WHAT IS SOMETHING YOU (AS WORKSHOP PARTICIPANTS) CAN CONTRIBUTE TO CLIMATE CHANGE PLANNING?

1

<u>Goal</u>: Target communication and education efforts to visitors, residents, and the hospitality industry

- <u>Impacts addressed</u>: Increasing shoulder season recreation (issues of safety and access)
- •Modeling green sustainability on MDI

Strategies:

- 1. Develop media for winter use, safety & access for visitors
- 2. Develop asynchronous hospitality trainings
- 3. Coordinate island-wide communication efforts
- 4. Communicating what it means to visit MDI

2

<u>Goal</u>: Focus on sustainable transportation

- Impacts addressed: Crowding, air quality, and traffic congestion
- Modeling green sustainability on MDI
- 5. Increase walkability downtown
- 6. Increase bike lanes
- 7. Improve green infrastructure
- 8. Increase Island Explorer and carpooling use

3

<u>Goal</u>: Continue to collect, analyze, and share data regarding visitation to MDI

- <u>Impacts addressed</u>: Increase collaboration
- Address issues of increasing visitation through knowledge generation
- 9. Create central hub for data sharing
- 10. Visitor projections in MDI

4

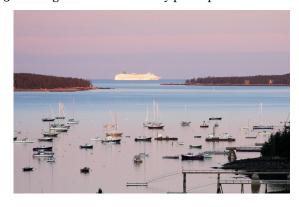

<u>Goal</u>: Maximize the ability of the hospitality industry to handle increasing visitation during the shoulder seasons

- •<u>Impacts addressed</u>: Increasing visitation (esp. during shoulder seasons)
- •Issues with hiring and retaining employees

- 11. Ensure housing for staff and employees
- 12. Winterize infrastructure in park

•

Figure 3. List of goals brainstormed by participants to address climate change impacts and accompanying action strategies.

IDENTIFIED EXISTING TOURISM RESOURCES

A Climate to Thrive: partnerships, intern, community education resources, EV charging station network

League of Towns: Communication, resources

Friends of Acadia: Media

ANP: Education programs

Acadia TV Channel

Maine Office of Tourism

Existing data already collected

STRENGTHS, BARRIERS, & RESOURCES

- Existing resources include a variety of employees and members within several groups working in the area such as A Climate to Thrive, Friends of Acadia, College of the Atlantic, Acadia National Park, League of Towns, and Maine Office of Tourism.
- Barriers include a lack of a dedicated and long-term leadership position to ensure a consistent messaging and collaboration, and the funding and the time necessary to complete these actions.
- Despite these barriers, a variety of organizations exist within MDI that have the ability to connect to groups, facilitate partnerships, and secure funding.

IMPLICATIONS

- There have been many useful climate change initiatives on MDI. The goal of these workshops was to incorporate considerations of system-wide tourism impacts and actions strategies.
- By inviting tourism stakeholders that represent different supplier groups, we believe that this participatory approach increased networks of collaboration and ownership of the planning process, facilitated the co-production of knowledge between stakeholder groups, and resulted in diverse, locally relevant management solutions.

Thank you to all who attended!

These workshops were developed by a team of student researchers in collaboration with community partners on MDI, including: Alf Anderson, Michael Boland, Valeria Briones, Stephanie Clement, Asha DiMatteo-LePape, Lydia Horne, Rich MacDonald, Alyssa Soucy, and Gabriela Wolf-Gonzalez.

This project was funded by the University of Maine Senator George J. Mitchell Center for Sustainability Solutions. Additional funding to support student facilitators came from the NSF-NRT Conservation Science Program (grant 1828466), NOAA (grant NA17OAR4310249), USDA-NIFA (McIntire-Stennis project number ME0-42017), the USDA-AFRI Agriculture and Natural Resources Science for Climate Variability and Change (AFRI ANRCVC) Challenge Area Program (grant 2018-69002-27933), the UMaine Office of the President, & the Department of Ecology & Environmental Sciences.
